

1- After installing XAMPP application and if you need to save your PHP files on your PC, in what a place can you save it and in what extension for these files?

- we save them in xampp > htdocs > server(optional), with .php extension

2. htdocs is acronyms for what?

- **HTDOCS** is not an acronym, but rather a directory name commonly used in web server configurations, “**htdocs**” are conventional directory used as the **document root** for serving web content

3. Suppose your PC is running with Windows operating system, can you install MAMP package on it? Explain your answer

- Yes, MAMP is a local server environment that allows you to run web applications on your desktop for testing or development purposes. While it is commonly associated with macOS, you can indeed install MAMP on a Windows operating system as well.

4. Give me some examples about some web sites that are built with PHP.

- Facebook
- Wikipedia
- Slack
- WordPress
- Spotify
- Yahoo

5. As you remember, JavaScript is a popular client-side programming language and it has the ability to change the content and style of a web page dynamically. One question you may be asking is, “Why do we need a server-side programming language, too?”

-Server-side scripting is an essential component of modern web development. It allows us to create dynamic and interactive websites that can handle complex tasks and deliver personalized content to users
